CONVERGENCE OF SZÁSZ-MIRAKYAN TYPE OPERATORS

ZBIGNIEW WALCZAK

Abstract. We introduce certain modification of Szász-Mirakyan operators and we study approximation properties of these operators. The result is in a form convenient for applications.

MSC 2000. 41A36.

Keywords. Szász-Mirakyan operator, polynomial weighted spaces, order of approximation.

1. INTRODUCTION

Approximation properties of Szász-Mirakyan operators

\( S_n(f; x) := e^{-nx} \sum_{k=0}^{\infty} \frac{(nx)^k}{k!} f \left( \frac{k}{n} \right), \)

\( x \in \mathbb{R}_0 := [0, +\infty], \ n \in \mathbb{N} := \{1, 2, \ldots\}, \) in polynomial weighted spaces \( C_p \) were examined in [1]. The space \( C_p, \ p \in \mathbb{N}_0 := \{0, 1, 2, \ldots\}, \) considered in [1] is associated with the weighted function

\( w_0(x) := 1, \ w_p(x) := (1 + x^p)^{-1}, \) if \( p \geq 1, \)

and consists of all real-valued functions \( f, \) continuous on \( \mathbb{R}_0 \) and such that \( w_pf \) is uniformly continuous and bounded on \( \mathbb{R}_0. \) The norm on \( C_p \) is defined by the formula

\( \|f\|_p \equiv \|f(\cdot)\|_p := \sup_{x \in \mathbb{R}_0} w_p(x) |f(x)|. \)

In this section we shall give some properties of the above operators, which we shall apply to the proof of the theorem. Most of these can be found in [1].

A. \( S_nf \) is a positive linear operator \( C_p \rightarrow C_p. \)
B. \( S_n(1; x) = 1, \ S_nf \) preserves constants.
C. For \( f \in C_p, \ p \in \mathbb{N}_0, \)

\( w_p(x)|S_n(f; x) - f(x)| \leq K_1(p)\omega_2 \left( f; C_p; \sqrt{\frac{x}{n}} \right), \ x \in \mathbb{R}_0, \ n \in \mathbb{N}, \)

where \( \omega_2(f; \cdot) \) is the modulus of smoothness of the order 2 and \( K_1(p) \) is a positive constant.

\( ^* \)Institute of Mathematics, Poznań University of Technology, Piotrowo 3A, 60-965 Poznań, Poland, e-mail: zwalczak@math.put.poznan.pl.
D. For \( f \in C^2_p := \{ f \in C_p : f', f'' \in C_p \}, p \in \mathbb{N}_0 \),
\[
\lim_{n \to \infty} n(S_n(f; x) - f(x)) = \frac{x}{2} f''(x), \quad x \in \mathbb{R}_0.
\]

E. For every \( 2 \leq q \in \mathbb{N} \) we have
\[
S_n((t-x)^q; x) = \sum_{j=1}^{\lfloor q/2 \rfloor} c_{j,q} \frac{x^j}{n^{q-j}}, \quad x \in \mathbb{R}_0, \quad n \in \mathbb{N},
\]
where \( c_{j,q} \) are positive numerical coefficients depending only on \( j \) and \( q \) (\( \lfloor y \rfloor \) denotes the integral part of \( y \in \mathbb{R}_0 \)) (see [17, 20]).

From (4) it was deduced that
\[
\lim_{n \to \infty} S_n(f; x) = f(x),
\]
for every \( f \in C_p, p \in \mathbb{N}_0 \) and \( x \in \mathbb{R}_0 \). Moreover, the above convergence is uniform on every interval \([x_1, x_2]\), \( x_1 \geq 0 \).

The Szász-Mirakyan operators and their connections with different branches of analysis, such as convex and numerical analysis have been studied intensively. We refer the readers to P. Gupta and V. Gupta [8], N. Ispir and C. Atakut [15], V. Gupta, V. Vasishtha and M. K. Gupta [12], G. Feng [6], [7], A. Ciupa [3], J. Grof [14]. Their results improve other related results in the literature.

The actual construction of the Szász-Mirakyan operators requires estimations of infinite series which in a certain sense restrict their usefulness from the computational point of view. Thus the question arises, whether the Szász-Mirakyan operators and their generalizations cannot be replaced by a finite sum, provided this will not change the order of approximation. In connection with this question in the paper [16] were considered certain positive linear operators for function of one variable
\[
S_n(f; a_n; x) := e^{-nx} \sum_{k=0}^{\lfloor n(x+a_n) \rfloor} \frac{(nx)^k}{k!} f \left( \frac{k}{n} \right), \quad x \in \mathbb{R}_0, \quad n \in \mathbb{N},
\]
where \((a_n)_1^\infty\) is a sequence of positive numbers such that \( \lim_{n \to \infty} \sqrt{n} a_n = \infty \).

In [16] it was proved that if \( f \in C_p, p \in \mathbb{N}_0 \), then
\[
\lim_{n \to \infty} S_n(f; a_n; x) = f(x)
\]
for every \( f \in C_p, p \in \mathbb{N}_0 \) and \( x \in \mathbb{R}_0 \). Moreover, the above convergence is uniform on every interval \([x_1, x_2]\), \( x_1 \geq 0 \).

Similar results in exponential weighted spaces can be found in [23].

The construction introduced the operators (7) not change the order of approximation.
In the paper [21] it was examined similar approximation problems for the following operators

\[ L_n(f; x) := \frac{1}{(1+(x+n^{-1})^2)^n} \sum_{k=0}^{n} \binom{n}{k}(x + n^{-1})^{2k}f \left( \frac{k(1+(x+n^{-1})^2)}{nx+1} \right), \]

\( f \in C_p, p \in \mathbb{N}_0, x \in \mathbb{R}_0 \) and \( n \in \mathbb{N} \).

Thus the new question arises, whether the order of approximation given in C and D cannot be improved.

In connection in this question we propose a new family of linear operators. This together with the form of the operator makes results, given in the present paper, more helpful from the computational point of view.

In this paper we shall denote the suitable positive constants depending only on \( \alpha \) by \( K_i(\alpha), i = 1, 2, \ldots \).

2. MAIN RESULTS

Similarly as in the paper [20] (see also [22]) let \( D_p, p \in \mathbb{N}, \) be the set of all real-valued functions \( f(x) \), continuous on \( \mathbb{R}_0 \) for which \( w_p(x) = x^k f^{(k)}(x) \), \( k = 0, 1, 2, \ldots, p, \) are continuous and bounded on \( \mathbb{R}_0 \) and \( f^{(p)}(x) \) is uniformly continuous on \( \mathbb{R}_0 \). The norm on \( D_p, p \in \mathbb{N}, \) is given by (3).

Approximation properties of modified Szász-Mirakyan operators

\[ A_n(f; p; x) := e^{-nx} \sum_{k=0}^{\infty} \frac{(nx)^k}{k!} \sum_{j=0}^{p} \frac{f^{(j)}(\frac{k}{n})}{j!} \left( x - \frac{k}{n} \right)^j, \quad x \in \mathbb{R}_0, \quad p \in \mathbb{N}, \]

in \( D_p \) were examined in [20].

In [20] it was obtained that if \( f \in D_p, p \in \mathbb{N}, \) then

\[ \| A_n(f; p; \cdot) - f(\cdot) \|_p = O(n^{-p/2}). \]

The assertion (10) for the operators \( A_n \) and \( f \in C'_0 := \{ f \in C_0 : f', \ldots, f^{(r)} \in C_0 \} \) is given in [17].

We introduce the following

**Definition 1.** For functions \( f \in D_p, p \in \mathbb{N}, \) we define the operators \( B_n \)

\[ B_n(f; a_n; p; x) := e^{-nx} \sum_{k=0}^{[n(x+a_n)]} \frac{(nx)^k}{k!} \sum_{j=0}^{p} \frac{f^{(j)}(\frac{k}{n})}{j!} \left( x - \frac{k}{n} \right)^j, \quad x \in \mathbb{R}_0, \]

where \( (a_n)_n^{\infty} \) is a sequence of positive numbers such that \( \lim_{n \to \infty} \sqrt{n}a_n = \infty. \)

In this paper we shall study a relation between the order of approximation by \( B_n \) and the smoothness of the function \( f. \)

Now we shall give approximation theorem for \( B_n. \)

The methods used in to prove Theorem are similar to those used in construction of modified Szász-Mirakyan operators [14, 16, 23].
Theorem 2. Fix $p \in \mathbb{N}$. Then for $B_n$ defined by (11) we have

$$
\lim_{n \to \infty} \left\{ B_n(f; a_n; p; x) - f(x) \right\} = 0, \quad f \in D_p,
$$

uniformly on every interval $[x_1, x_2]$, $x_2 > x_1 \geq 0$.

Proof. We first suppose that $f \in D_p$, $p \in \mathbb{N}$. From (11) and (9) we obtain

$$
B_n(f; a_n; p; x) - f(x) =
$$

$$
e^{-nx} \sum_{k=0}^{\infty} \frac{(nx)^k}{k!} \sum_{j=0}^{p} \frac{f^{(j)}(\frac{k}{n})}{j!} \left( x - \frac{k}{n} \right)^j - f(x)
$$

$$
e^{-nx} \sum_{k=0}^{\infty} \frac{(nx)^k}{k!} \sum_{j=0}^{p} \frac{f^{(j)}(\frac{k}{n})}{j!} \left( x - \frac{k}{n} \right)^j - f(x)
$$

$$
- e^{-nx} \sum_{k=[nx+a_n]+1}^{\infty} \frac{(nx)^k}{k!} \sum_{j=0}^{p} \frac{f^{(j)}(\frac{k}{n})}{j!} \left( x - \frac{k}{n} \right)^j
$$

$$
= A_n(f; p; x) - f(x) - M_n(f; x), \quad x \in \mathbb{R}_0, \quad n \in \mathbb{N}.
$$

By our assumption, using the elementary inequality $(a + b)^k \leq 2^{k-1}(a^k + b^k)$,

$$
|f^{(k)}(t)| \leq K_2(1 + 4^{p-k})
$$

$$
\leq K_2(1 + (|t - x| + x)^{p-k})
$$

$$
\leq K_2(1 + 2^{p-k-1}(|t - x|^{p-k} + x^{p-k})), \quad k = 0, 1, 2, \ldots, p.
$$

From this and by (1) we get

$$
|M_n(f; x)| \leq
$$

$$
e^{-nx} \sum_{k=[nx+a_n]+1}^{\infty} \frac{(nx)^k}{k!} K_2 \sum_{j=0}^{p} \left( 1 + 2^{p-j-1} \left( \left| \frac{k}{n} - x \right|^{p-j} + x^{p-j} \right) \right) \left| \frac{k}{n} - x \right|^j
$$

$$
\leq K_2 \sum_{j=0}^{p} \left( 1 + 2^{p-j-1}x^{p-j} \right) e^{-nx} \sum_{k=[nx+a_n]+1}^{\infty} \frac{(nx)^k}{k!} \left| \frac{k}{n} - x \right|^j
$$

$$
+ 2^{p-j-1}e^{-nx} \sum_{k=0}^{\infty} \frac{(nx)^k}{k!} \left| \frac{k}{n} - x \right|^j
$$

$$
= K_2 \sum_{j=0}^{p} \left( 1 + 2^{p-j-1}x^{p-j} \right) e^{-nx} \sum_{k=[nx+a_n]+1}^{\infty} \frac{(nx)^k}{k!} \left| \frac{k}{n} - x \right|^j
$$

$$
+ 2^{p-j-1}S_n \left( |t - x|^p; x \right).
$$
We remark that
\[
\begin{align*}
  e^{-nx} \sum_{k=[n(x+a_n)]+1}^{\infty} \frac{(nx)^k}{k!} \left| \frac{k}{n} - x \right|^j \\
  \leq e^{-nx} \sum_{a_n < k/n}^{\infty} \frac{(nx)^k}{k!} \left| \frac{k}{n} - x \right|^j \\
  \leq \frac{1}{a_n} e^{-nx} \sum_{k=0}^{\infty} \frac{(nx)^k}{k!} \left| \frac{k}{n} - x \right|^{p+j} = \frac{1}{a_n} S_n \left( |t - x|^{p+j}; x \right).
\end{align*}
\]

From this and in view of (5), the Hölder inequality and the property \( S_n(1; x) = 1 \), we further have
\[
|M_n(f; x)| \leq K_3 \left( \sum_{j=0}^{p} \frac{1+2p-j-1}{a_n} \left( S_n \left( (t - x)^{2p+2j}; x \right) \right)^{1/2} \\
  + 2^{p-1} \left( S_n \left( (t - x)^{2p}; x \right) \right)^{1/2} \right),
\]
\[
= K_3 \left( \sum_{j=0}^{p} \frac{1+2p-j-1}{a_n} \left( \sum_{i=1}^{p+j} c_i 2p+2j x^i \right) \right)^{1/2} \\
  + 2^{p-1} \left( \sum_{i=1}^{p} c_i 2p x^i \right)^{1/2},
\]
\[
\leq \frac{K_4}{n^{p/2}} \left( \frac{1}{a_n} \sum_{j=0}^{p} \left( 1 + 2p-j-1 \right) \left( \sum_{i=1}^{p+j} c_i 2p+2j x^i \right) \right)^{1/2} \\
  + 2^{p-1} \left( \sum_{i=1}^{p} c_i 2p x^i \right)^{1/2},
\]
where \( K_3, K_4 \) are some positive constants depending only on \( p \). The properties of \( a_n \)
\[
\lim_{n \to \infty} \sqrt{n} a_n = \infty
\]

imply that
\[
\lim_{n \to \infty} M_n(f; x) = 0
\]
uniformly on every interval \([x_1, x_2] , x_2 > x_1 \geq 0\). From this and by (10) we obtain
\[
\lim_{n \to \infty} \{ B_n(f; a_n; p; x) - f(x) \} = 0,
\]
uniformly on every interval \([x_1, x_2] , x_2 > x_1 \geq 0\). This ends the proof of (12).
3. REMARKS

Applying (10), the equality
\[ B_n(f; a_n; p; x) = A_n(f; p; x) - f(x) - M_n(f; x) \]
and arguing as in the proof of Theorem it is easy verified that operators \( B_n, n \in \mathbb{N} \), give better the order of approximation \( O(n^{-p/2}) \) function \( f \in D_p, p \in \mathbb{N} \), than \( S_n \) and the operators examined in [16, 21, 23] \( O(n^{-1}) \).

Observe that analogous approximation properties hold for the following operator
\[ C_n(f; p; x) := e^{-nx} \sum_{k=0}^{n} \frac{(nx)^k}{k!} \sum_{j=0}^{p} \frac{f^{(j)}(k/n)}{j!} (x - k/n)^j, \]
\( f \in C_{[0,1]}, x \in [0, 1), n \in \mathbb{N}. \)
We may remark here that the operator \( C_n, n \in \mathbb{N} \), obtained from (11) for \( a_n = 1 - x, x \in [0, 1). \)
